

Course Syllabus and Prerequisites

Abstract

Generative AI for Data Analytics demonstrates the integration of Generative Artificial Intelligence (Generative AI) in data analytics. This course demonstrates how to use generative AI tools, frameworks, and platforms to increase the effectiveness of various processes involved in the data analytics lifecycle.

You will learn how to use and apply generative models for tasks such as data generation, data augmentation, data preparation, and finding insights, querying databases, generating visualizations, and storytelling. You will also explore challenges and ethical considerations associated with using Generative AI in data analytics.

Disclaimer

In this course, you will be using free versions or trials of various Generative AI tools to learn the concepts. Paid versions are not required to complete this course. If you decide to upgrade to a paid version, you will be responsible for any charges that you may incur.

Course prerequisites:

An introductory knowledge of data analytics, generative AI, and prompt engineering would be beneficial. You can check these courses to get a basic understanding of these topics:

- [Generative AI: Introduction and Applications](#) 
- [Generative AI: Prompt Engineering Basics](#) 

Course Syllabus

Module 1: Data Analytics and Generative AI

- Welcome
- Data Analytics and Generative AI
- Generative AI for Data Preparation and Insights
- Module Summary & Assessment

Module 2: Use of Generative AI for Data Analytics

- Generative AI for Data Visualization and Storytelling
- Generative AI Considerations in Data Analytics
- Module Summary & Assessment

Module 3: Final Project and Final Exam

- Final Project
- Final Exam
- Course Wrap-Up
